SteamProject Summary

Overview

SteamProject is a desktop application created with Java-JavaFX planned to imitate the Steam store. It allows clients to find, buy, and manage games. Clients can make accounts, sign in, alter their profiles, and check their buy records. All exercises by clients are backed by a database, guaranteeing that their information is stored.

Client Stream and Highlights

First, new clients input their individual data, which incorporates their username, name, email address, password, phone number, and birth date. Once approved, this data is spared within the database. Clients who are logged in can get to their profiles, make changes, or delete their accounts.

The essential interface grandstands the store where clients can browse and channel games by category or title. Each game highlights an picture, a description, price, rating, release date, category and hardware requirements. A game can be bought simply using the "Buy" button. Completed purchases are recorded within the user's buy history.

The library regroups client's buy history. Clients can get to their buy history and return to the store at whatever point they wish.

Some used methods

- authenticateUser: Confirms login information.
- handleSignUp: Checks and spares unused client data.
- handleLogin: Allows the client in and displays their profile.
- handleUpdateProfile: Updates client data within the database.
- buyGame: Allow the client to buy a game and saves it.
- handleSearch: Sorts games based on keywords or categories.
- setUserId: Keeps up the current user's ID across diverse scenes.

Diagrams

Use Case:

After authentication, the use case shows all the possible actions that can be executed by the user (client).

Class diagram:

Regroups the code's methods and classes, and their links.

Sequence Diagram:

The chosen action here is buying a game. It goes from clicking on the buy button to saving the purchase in the database after payment to then confirming it and adding it to the client's library.

Conclusion

SteamProject displays a user-friendly desktop application that gives total management of accounts and the store, allows buying and searching for the games stored in the database.
